

The Future of Work, Work of the Future

IoT and digitalization transforms the way we live and our workplaces are no exceptions. 6 out of 10 jobs will be affected by the change in the next 2 decades in the OECD countries, according to the expectations of the World Bank. Today there are around 1,5 million robots helping us, humans at work but the number of thinking and self-developing machines can reach up to 6 million within the next few years and AI will transform the world of work not only in the industry but also in the service sector. There will be many jobs that disappear and new ones will be born, thus 70% of the young who start their career in the future, will work in positions that do not exist today.

Invitation

GE Hungary which already uses 17 data analyzing robots in its Global Operations Center, employing around 2.500 staff, cordially invites you to its "The Future of Work, the Work of Future" conference. Let's look at where we are heading and let's try to imagine the future of work!
